8 scanner configurations for every market scenario — platform agnostic, ready to use on any scanning tool.

These scanner configurations are platform-agnostic — the filter logic works on any scanning tool including Webull, Finviz, TradingView, thinkorswim, TradeStation, and StockBeep. For each scanner you get the exact filter values, the reasoning behind each one, what to look for when something hits, and when to run it during the trading day. Use these as your starting point and refine based on your own observations over time.

HOW TO USE THIS PACK

→ Run scanners in sequence during your pre-market routine — not all at once.

→ A stock appearing on multiple scanners simultaneously is a high-conviction candidate.

→ Scanner hits are candidates, not trades. Every hit still requires a technical setup and defined risk.

→ Volume thresholds may need adjustment based on your broker — some report pre-market volume differently.

→ Refine filter values over time as you observe which hits actually produce quality setups in your style.

SCANNER 1

Pre-Market Gap and Go Scanner

Best used: 6:00 AM – 9:25 AM EST

Identifies stocks that have gapped significantly pre-market on a real catalyst and are holding their gap. These are your highest-priority plays for the open — stocks with urgency behind them that are likely to continue moving when the market opens.

EXACT FILTER SETTINGS

FILTER	VALUE	WHY
Price	$2.00 – $100.00	Eliminates sub-penny stocks and institutional names that gap too wide to trade efficiently
Pre-Market Volume	Minimum 100,000 shares	Confirms genuine interest — thin pre-market volume gaps rarely follow through
Pre-Market % Change	Gap up: +5% or more / Gap down: -5% or more	Only interested in significant gaps with real momentum
Relative Volume (RVOL)	2.0x or higher	Volume must be meaningfully elevated above the stock's normal pre-market activity
Average Daily Volume	Minimum 500,000 shares	Needs enough liquidity for clean execution at the open
Float	Under 50 million shares (preferred under 20M for stronger moves)	Lower float = more price movement per dollar of volume

WHAT TO LOOK FOR WHEN SOMETHING HITS

Check for a real catalyst first — earnings beat, FDA decision, major news. No catalyst means low follow-through. Look for the stock to hold its gap level in pre-market. If it is already fading back toward the prior close before the open, skip it. The best gap and go setups have a tight pre-market range with high volume — price consolidating near the high of the gap.

Webull Scanner · Finviz Screener · TradingView Screener · StockBeep · thinkorswim Scan

SCANNER 2

First Green Day Scanner

Best used: 7:00 AM – 9:25 AM EST

Finds stocks that have been declining or consolidating and are showing the first significant green pre-market session. The first green day signals a potential shift in momentum — new buyers entering a stock that has been under selling pressure. Combined with a catalyst, this is one of the most reliable small cap setups.

EXACT FILTER SETTINGS

FILTER	VALUE	WHY
Price	\$1.00 – \$20.00	First green day is most powerful on small and micro cap stocks
Pre-Market % Change	+8% or more	Needs to be a significant green day — not just a minor bounce
Pre-Market Volume	Minimum 200,000 shares	Must show real participation on the first green session
Average Daily Volume (20-day)	Under 1,000,000 shares	Looking for stocks that have been quiet — the volume spike stands out more
Price vs 20-day SMA	Trading below 20-day SMA prior session	Confirms the stock was in a downtrend or consolidation before this move
Short Interest	Over 15% preferred	High short interest adds potential short squeeze fuel to the move

WHAT TO LOOK FOR WHEN SOMETHING HITS

The catalyst is everything on first green day plays. Look for a clear reason — earnings, news, sector catalyst. Check the prior sessions: was the stock declining or flat before this move? A stock that was down 5 sessions in a row and just gapped up 12% on earnings is the setup. Look for the gap to hold during pre-market. The best first green days close near their pre-market high on heavy volume.

Webull Scanner · Finviz Screener · TradingView Screener · Trade Ideas

SCANNER 3

Washout Long Scanner

Best used: 9:30 AM – 11:00 AM EST

Identifies stocks that have experienced a sharp, fast sell-off intraday — typically a stop loss cascade or liquidity sweep — and are showing early signs of recovery. Washout longs are counter-trend entries at the point of maximum pain, where forced sellers have exhausted themselves and a reversal is beginning.

EXACT FILTER SETTINGS

FILTER	VALUE	WHY
Price	$5.00 – $200.00	Needs enough liquidity for the washout to be tradeable
Intraday % Change	-8% to -20% from prior close	Looking for significant intraday sell-offs, not normal pullbacks
Intraday Volume Spike	3x or more average per-minute volume on the flush candle	The flush must happen on a volume spike — confirms forced selling and potential exhaustion
Price vs VWAP	Currently trading below VWAP	Washout must be significant enough to push price well below the intraday average
Average Daily Volume	Minimum 500,000 shares	Needs enough normal volume for the reversal to have fuel
Time of Day Filter	9:35 AM – 10:45 AM EST	Washout longs are most powerful in the first hour — avoid this setup in the afternoon

> **WHAT TO LOOK FOR WHEN SOMETHING HITS**
>
> This setup requires real-time monitoring — you need to see the washout happen, not just find it after the fact. Watch for a large volume spike candle that pushes to new intraday lows, followed by immediate recovery. The recovery candle should be green and close in the upper half of its range. The entry is on the first green candle after the flush, with a stop below the washout low. Half size always — washout longs are high risk.

Webull Real-Time Scanner · Trade Ideas Real-Time · thinkorswim Real-Time Scan

SCANNER 4

IBS Play Scanner

Best used: Run after market close — for next day trading

Finds stocks that closed near the extreme low (IBS under 0.2) or extreme high (IBS over 0.8) of their daily range, signaling a potential mean reversion move the following session. This scanner runs after the market closes and builds your next-day watchlist for IBS setups.

EXACT FILTER SETTINGS

FILTER	VALUE	WHY
IBS Value	Under 0.20 for long setups / Over 0.80 for short setups	IBS = (Close - Low) / (High - Low). Under 0.20 = closed near day's low. Over 0.80 = closed near day's high
Price	$10.00 or higher	IBS works best on more liquid, less volatile stocks
Average Daily Volume	Minimum 1,000,000 shares	Higher liquidity = more reliable mean reversion tendency
Price vs 200 SMA	Above 200 SMA for long setups	Only take long IBS plays in stocks with a bullish long-term trend
Earnings	No earnings within 5 trading days	Earnings events override the mean reversion tendency — skip those names
Daily Range	Minimum 2% range (High - Low / Close)	The day needs to have had a real range for the IBS reading to be meaningful

WHAT TO LOOK FOR WHEN SOMETHING HITS

IBS is a systematic strategy — the edge comes from applying it consistently across a universe of stocks, not cherry-picking. After running the scanner, review the chart of each hit briefly: is the stock in a clear trend? Is the IBS low coming on a normal pullback or a news-driven collapse? Normal pullback + IBS under 0.20 + above 200 SMA = strong setup. News-driven collapse = skip it.

Finviz Screener (after close) · TradingView Screener · thinkorswim Scan · StockAnalysis.com

SCANNER 5

Short Squeeze / Float Rotation Scanner

Best used: 6:00 AM – 9:25 AM EST

Finds small cap stocks with extremely high short interest that are showing significant pre-market strength on a catalyst. When heavily shorted stocks receive positive catalysts, short sellers are forced to cover — creating a feedback loop of buying that can produce explosive moves of 50-300% or more in a single session.

EXACT FILTER SETTINGS

FILTER	VALUE	WHY
Price	$1.00 – $15.00	Short squeezes are most explosive on low-priced small caps
Float	Under 10 million shares	Extremely low float amplifies every move — fewer shares means more price impact per dollar
Short Interest	Over 20% of float	High short interest is the fuel — the more shorts trapped, the more violent the squeeze
Pre-Market % Change	+15% or more	Needs a significant move to start triggering short covering
Pre-Market Volume	Minimum 500,000 shares	Short squeezes need serious volume to force covering
Catalyst Required	Yes — mandatory	A squeeze without a catalyst stalls quickly. Need earnings, FDA, or major news to force shorts to act

WHAT TO LOOK FOR WHEN SOMETHING HITS

Short squeeze setups are the highest reward and highest risk plays in the market. The move can be 100-300% in a single day — or it can reverse and give back everything just as fast. Always check: how many days to cover (short interest divided by average daily volume)? More than 5 days to cover = severe squeeze potential. Look for price to hold above pre-market support at the open. If it immediately fades back, the squeeze may be running out of fuel. Take profits aggressively — these do not hold.

Webull Scanner · Finviz Screener · Chartmill Short Interest · Shortsqueeze.com

SCANNER 6

Swing Trade Breakout Scanner

Best used: Run after market close — for next 1-5 days

Identifies stocks breaking out of multi-week or multi-month consolidation bases on above-average volume. Swing trade breakouts are higher timeframe setups held for days to weeks — not intraday. This scanner runs after close and builds your swing trade watchlist for the coming sessions.

EXACT FILTER SETTINGS

FILTER	VALUE	WHY
Price	$10.00 or higher	Swing trades require enough liquidity to scale in and out over multiple sessions
Daily Volume vs 50-day Average	1.5x or higher on the breakout day	Volume must confirm the breakout — low volume breakouts from bases fail frequently
Price vs 52-week High	Within 5% of 52-week high or at all-time high	Blue sky breakouts with no overhead resistance are the strongest swing setups
Weeks in Base	Minimum 3 weeks of consolidation	Longer base = more powerful move. Scan for tight weekly ranges before the breakout
Average Daily Volume	Minimum 500,000 shares	Needs sufficient liquidity for multi-day holds
RS Rating (Relative Strength)	Top 30% vs S&P 500 over 6 months	Only swing trade stocks that are outperforming the market over the prior 6 months

WHAT TO LOOK FOR WHEN SOMETHING HITS

After the scanner hits, pull up the weekly chart first. Is this a clean base? Has volume contracted during the consolidation and expanded on the breakout? Check for any major overhead resistance levels above the breakout point. The best swing breakouts have tight weekly ranges for 4-8 weeks with declining volume, then a breakout week with 2-3x normal volume. Look for the stock to close near the high of the breakout day.

Finviz Screener · TradingView Screener · thinkorswim Scan · MarketSmith

SCANNER 7

Afternoon Fade / Bear Flag Scanner

Best used: 12:00 PM – 2:30 PM EST

Finds stocks that had a strong morning move but are now showing signs of distribution and fading into the afternoon. The afternoon fade is one of the most reliable intraday patterns — stocks that ran hard in the morning frequently give back significant gains as morning buyers take profits and momentum fades.

EXACT FILTER SETTINGS

FILTER	VALUE	WHY
Intraday % Change vs Open	-5% or more from intraday high	The stock must have already started fading — looking for confirmation of the reversal
Price vs VWAP	Trading below VWAP after trading above it earlier	VWAP recross to the downside signals institutional sellers are taking control
Volume Pattern	Volume declining on bounces, expanding on sell-offs	Confirms distribution — sellers are more aggressive than buyers on each move
Price	$5.00 or higher	Lower priced stocks are more erratic in the afternoon — skip them for this setup
Morning High vs Current Price	Currently trading in lower 50% of day's range	Confirms the fade is real and not just a minor pullback from highs
Time Filter	12:00 PM – 2:30 PM EST only	Afternoon fades work best in this window. Avoid the last 30 minutes — power hour can reverse fades

WHAT TO LOOK FOR WHEN SOMETHING HITS

The entry on an afternoon fade is on a break below the consolidation low after the initial bounce off VWAP. Look for a clear bear flag forming — a weak bounce on low volume after the initial VWAP break, then a continuation lower. Stop goes above the bear flag high. Target is the morning support level or a 50-61.8% retracement of the morning move. This is a short setup — only use if your broker allows it.

Webull Real-Time Scanner · TradingView Real-Time · thinkorswim Real-Time

SCANNER 8

Unusual Options Activity Scanner

Best used: 9:30 AM – 3:30 PM EST

Monitors for unusually large options orders — calls or puts — that are significantly above normal activity for a given stock. Large options orders often precede significant price moves. When smart money or institutions are positioning heavily in options, it frequently signals they expect a major move in the underlying stock.

EXACT FILTER SETTINGS

FILTER	VALUE	WHY
Options Volume vs Open Interest	Volume 3x or higher than open interest	When volume dramatically exceeds open interest, new positions are being opened — not just closing existing ones
Premium Paid	$500,000 or more in a single order	Large premium amounts signal institutional conviction — retail traders do not spend $500k on a single options trade
Expiration	Current week or next week expiration	Near-term expiration means the trader expects the move soon — not a long-term hedge
Call/Put Ratio	Unusual skew toward calls (bullish) or puts (bearish)	A 5:1 call/put ratio is normal on most days. A 20:1 ratio signals unusual bullish positioning
Strike vs Current Price	At or slightly out of the money	At-the-money and slightly OTM unusual activity is most significant — it is a directional bet, not a hedge
Stock Price	$10.00 or higher	Options on sub-$10 stocks are often too illiquid to interpret clearly

> **WHAT TO LOOK FOR WHEN SOMETHING HITS**
>
> Unusual options activity is a signal, not a trade. You still need a technical setup in the underlying stock. When you see a large unusual call order, pull up the stock chart — is there a valid setup? Is the stock near support? Forming a base? Breaking out? The options flow tells you smart money is positioned. The chart tells you where to enter with defined risk. Never blindly follow options flow without confirming the technical picture.

Market Chameleon · Unusual Whales · Barchart Options Flow · Cheddar Flow · Webull Options Flow

DAILY SCANNER SEQUENCE — PRE-MARKET ROUTINE

Run your scanners in this order each morning. Do not run all of them simultaneously and try to monitor everything — pick the 2-3 most relevant for current market conditions.

TIME	SCANNER	ACTION
6:00 – 7:00 AM	Gap and Go + Short Squeeze	Identify the top 3 gap plays and any squeeze candidates
7:00 – 8:00 AM	First Green Day	Add any FGD candidates to watchlist — check for catalyst
8:00 – 9:15 AM	Review and rank all candidates	Score each by catalyst quality + technical setup. Cut to top 3-5 names.
9:30 – 10:45 AM	Washout Long (real-time)	Monitor for washout setups on your watchlist names specifically
12:00 – 2:30 PM	Afternoon Fade + Options Flow	Look for fading morning runners and any new unusual activity
After Close	IBS + Swing Breakout	Build next-day watchlist from end-of-day scans

TST CORE PRINCIPLE

A scanner hit is a lead, not a trade. Every stock that appears on any of these scanners still requires a defined entry trigger, a stop loss level, and a price target before you place any order. The scanner narrows the universe. Your process and judgment determine whether you trade it.

TST Scanner Settings Pack — purchased from topstocktrading.com. Filter values are starting points — refine based on your own observations. Market conditions change; review your scanner settings quarterly.
